
Using the NephNet via the Clam Mobile App.

1. The Clamnet App can be found on both Google Play Store and the Apple App Store. Search for Clam Mobile and install the Clam app as seen on the left. Once installed launch the app to get the screen below (2).

2. Connect the BIT (Bluetooth Interface Tool) to the Nephnet Clam via the small silver connector. With the red dot on the plug aligned with the red dot on the socket the plug inserts easily – do not force. The blue led in the BIT will flash. Select Bluetooth which will search for available bluetooth devices. After a few seconds the screen similar to the one below (3) will be displayed.

3. Select Clam-BIT and the app will try to connect to the Nephnet Clam. After several seconds the screen below (4) should display. If you get a failed to connect message try again. If the waiting icon continues to display exit the app and start again.
If the Nephnet is to be installed at a single location for a significant period then there is no need to use the START NEW session option. So select the three bars at top left to take you to the screen after next.

If the Nephnet is to be used at several different locations as in a series of mains flushing jobs then data for each flush can be identified by location and GPS coordinates using the sessions feature.

To begin a session click START NEW to display the following screen (5).

Type in something meaningful to identify the session (address, Job Number etc)

The GPS function of the mobile device will automatically store to location coordinates for use later.

Once complete click OK and you will be returned to the screen above (4).

Select the three bars at top left to take you to the screen below (6).

Select Configuration to take you to the screen below (7).
At this point you can confirm the Logging Interval for which data readings are to be collected and the Upload Interval for period between connections to send data to the cloud.

The display can be changed for second, minutes, hours by clicking the right side triangles to make this task easier.

You can also set the range appropriate for the turbidity sensor.

If the readings are changed you MUST select SAVE at the top right otherwise the changes will be lost. Then follow on screen instructions until returned to the screen on the left.

Select the three bars at top left to take you to the screen below (8).

---

Select Disconnect to take you to the screen below (9).

Here there are the options to see live data from the turbidity sensor and to collect data stored in the NephNet Clam for browsing on the phone or later uploading to the cloud.

Click Live Data to display the current turbidity reading as below (9).

---

This option is particularly useful during mains flushing to have an instant indication of the turbidity level.

To exit this screen click the three bars top left, to display the option menu in the screen above (8).

Click Collect Data to take you to the screen below (10).
Click Collect Data again and the data in the NephNet Clam will be loaded to the App and display the message

**Success**
Data collection complete.
You can browse collected data after disconnecting from the instrument.

OK

Click to return to the screen on the left OK.
Click the three bars top left to display the option menu again and click Disconnect to see below (11).

This screen provides the opportunity to set the NephNet Clam to:
- Run Mode so that it will take readings and send them to the cloud, or
- Service Mode in which the NephNet Clam will not take readings or connect to the web platform.

Select the required option and select OK after which you will be returned to the Home screen.

From here you can either repeat the process to connect to another unit or exit the app by pressing the Home button on your phone.
Click the three bars top left to reveal menu below.
NOTE: After disconnecting the App from the NephNet unplug the BIT as this uses a small amount of battery from the unit.

Do not pull the cable – the plug locks in place and is released by holding the long silver section of the plug and pulling gently down.
ATi UK is a leading provider of engineered, analytical sensor monitoring solutions to the water and gas industry. Our pioneering and industry leading range of Network Monitors, Water Quality Monitors and Gas Detectors provide innovative solutions for the most demanding of applications.
